Olist Project: Zero-to-Published Guide

From the files you already have to a live Looker Studio dashboard, a pinned GitHub repository, and a LinkedIn Featured section. Written for someone who has never used Looker Studio, VS Code, Git or GitHub.

How to use this guide

Work through the parts in order. Each part says which file you need, what to click, and what you should see when it worked. Total time is about 60 to 90 minutes if everything is new to you. You can stop after any part and pick up later.

What you need before starting

Thing	Why	Where
olist-ecommerce-analytics.zip	The whole project folder (notebook, README, data, docs). I sent it to you in our chat.	Download from the chat and save it to your Desktop.
Google account **hafizgohardev@gmail.com**	The three data tables are already in this account's Google Drive, and Looker Studio uses the same login.	Already have it.
GitHub account	Hosts the code. Free.	github.com → Sign up, if you don't have one.
LinkedIn account	Featured section.	Already have it.
A computer with internet	VS Code and Git are installed in Part 3.	Windows or Mac both work; the guide shows both.

The big picture

Part	What you do	Result
1	Unzip the folder and learn what each file is	You know where everything is
2	Build the dashboard in Looker Studio (in your browser)	A live dashboard with a shareable link + a screenshot
3	Install VS Code and Git, put the folder on GitHub	Your repository is public on github.com
4	Pin the repository on your GitHub profile	It shows at the top of your profile
5	Add the dashboard and your warehouse project to LinkedIn Featured	Both are visible on your profile

Part 1 — Unzip the folder and know your files

1. Find **olist-ecommerce-analytics.zip** in your Downloads folder.
2. **Windows:** right-click it → **Extract All…** → choose your Desktop → Extract. **Mac:** double-click it; a folder appears next to it. Move that folder to your Desktop.
3. You now have a folder called **olist-ecommerce-analytics**. This folder is your project. Everything in this guide refers to files inside it.

What each file is for

File / folder	What it is	What you do with it
README.md	The front page of your GitHub repo. Already written (problem → what I did → what the client would see → tools).	In Part 3 you paste your Looker Studio link into it. Nothing else.
olist_data_cleaning.ipynb	The Jupyter notebook with all the pandas cleaning code and its outputs.	Nothing. GitHub displays it automatically. You do not need to run it.
data/dashboard/ (4 CSV files)	The aggregated tables the dashboard is built from. Copies of these are already in your Google Drive as Google Sheets.	Nothing. They are there so the repo is complete.
images/dashboard.png	Currently a preview chart. The README shows this image.	In Part 2 you replace it with your real Looker Studio screenshot.
docs/looker_studio_setup.md	Short technical version of Part 2.	Nothing.
src/build_dashboard_tables.py, requirements.txt, .gitignore	Supporting code and settings.	Nothing.
GITHUB_AND_LINKEDIN_STEPS.md	A short checklist, a condensed version of Parts 3 to 5.	Delete it before uploading (step 3.7) or keep it; either is fine.

Note: Files ending in **.md** are plain text. If you double-click one and your computer asks which program to use, pick Notepad (Windows) or TextEdit (Mac). In Part 3 you will open them in VS Code instead.

Part 2 — Build the dashboard in Looker Studio

Looker Studio is a free Google tool that turns a Google Sheet into charts. It runs in your browser; nothing to install. The three Sheets it needs are already in your Google Drive:

Google Sheet (in your Drive)	Used for
Olist Dashboard - Monthly	Revenue trend, Orders by month, Average delivery days
Olist Dashboard - Revenue by State	Revenue by region
Olist Dashboard - Top Products	Top 10 products

2.1 Create the report

1. Open your browser and go to **lookerstudio.google.com**. If asked, sign in with hafizgohardev@gmail.com. The first time, it may ask you to accept terms and pick your country; do that.
2. Click the blue **+ Create** button (top-left) → **Report**.
3. A panel titled *Add data to report* opens with many connectors. Click **Google Sheets**.
4. If a permission screen appears, click **Authorize** and allow access.
5. In the list of spreadsheets click **Olist Dashboard - Monthly**, then in the next column click the worksheet with the same name. Make sure **Use first row as headers** is ticked. Click **Add** (bottom-right). If it asks *Add data to this report?* click **Add to report**.
6. You are now in the editor. It adds a small table to the page automatically. Click it once and press **Delete** on your keyboard to remove it.
7. Top-left, click the text **Untitled Report** and type: **Olist E-Commerce – Sales & Delivery Overview**. Press Enter.

2.2 Add the other two data sources

1. In the toolbar click **Add data**.
2. Click **Google Sheets** → **Olist Dashboard - Revenue by State** → its worksheet → **Add** → **Add to report**.
3. Repeat: **Add data** → Google Sheets → **Olist Dashboard - Top Products** → worksheet → **Add** → **Add to report**.
4. Check the date column: menu **Resource** → **Manage added data sources** → next to *Olist Dashboard - Monthly* click **Edit**. Find the row **month**. Its *Type* should say **Date**. If it says *Text*, click it and choose **Date & Time** → **Date**. Click **Done**, then **Close**.

Tip: While you are in that screen, click the Type of **revenue_brl** and choose **Currency** → **BRL - Brazilian Real**. Charts will then show R$ automatically.

2.3 Add the five tiles

Every chart is added the same way: **Insert** menu (or the **Add a chart** button) → pick a chart type → click anywhere on the page to place it → a panel opens on the right where you set **Data source**, **Dimension** (the category) and **Metric** (the number). You can drag a chart to move it and drag its corners to resize it.

#	Tile	Chart type	Data source	Dimension	Metric
1	Revenue trend	Time series	Monthly	month	revenue_brl (SUM)
2	Orders by month	Column chart	Monthly	month	orders (SUM)
3	Top 10 products	Bar chart (horizontal)	Top Products	product_label	revenue_brl (SUM), sort descending, rows per page = 10
4	Revenue by region	Bar chart (or Geo chart, see below)	Revenue by State	customer_region	revenue_brl (SUM), sort descending
5	Avg delivery days	Scorecard	Monthly	—	Avg delivery days (calculated field, see 2.4)

Detailed clicks for tile 1 (the others are identical except for the choices in the table):

1. **Insert → Time series chart**. Click on the page near the top-left to place it.
2. In the right panel under **Data source** make sure it says *Olist Dashboard - Monthly*. If not, click it and choose it.
3. Under **Dimension** it should say **month**. If it shows something else, click it and choose month.
4. Under **Metric** click the field and choose **revenue_brl**. Looker Studio uses SUM by default, which is right.
5. Click the chart's title area, or in the right panel open the **Style** tab → **Title** → tick *Show title* and type **Monthly revenue (R$)**.
6. Drag the bottom-right corner so the chart is wide (about two-thirds of the page width).

For tile 4, if you prefer a map of Brazil: **Insert → Geo chart**, data source *Revenue by State*, Geo dimension **state_iso**, metric **revenue_brl**, and in the right panel set **Zoom area** to **Brazil**. If the map comes up empty, click the **state_iso** field type and set it to **Geo → Region**.

2.4 The average delivery days scorecard (needs one small formula)

The Monthly sheet stores delivery days per month. If you simply average that column you get the average of averages, which is wrong. The fix is a calculated field:

1. **Insert → Scorecard**. Place it to the right of the revenue trend.
2. In the right panel, under **Metric**, click the current field → at the bottom click **+ Add a field** (it may say *Create field*).
3. Field name: **Avg delivery days**. In the formula box type exactly:

```
SUM(delivery_days_total) / SUM(delivered_orders)
```

1. Click **Save** (bottom-right), then **Done**.
2. The scorecard should now show **12.6** (it may show 12.63; to show one decimal, open the **Style** tab → *Decimal precision* → 1).
3. Give it a title the same way as before: **Average delivery days**.

Tip: Two optional extra scorecards look good next to it: metric **revenue_brl** (shows R$ 15.7M) and metric **orders** (shows 98,199). Both from the Monthly source.

2.5 Arrange, share, screenshot

1. Arrange: revenue trend wide across the top, the scorecard(s) to its right, and the three remaining charts in a row underneath. If charts fall off the page, go to **Theme and layout** (toolbar) → **Layout** → set Canvas size to **Custom 1200 × 900**.
2. Optional: **Theme and layout** → **Theme** → pick any theme you like.
3. Share: click the blue **Share** button (top-right). In the window, under **Link settings** (or **General access**), change *Restricted* to **Anyone with the link** and keep the role as **Viewer**. Click **Copy link**, then **Done**.
4. Paste that link somewhere safe (Notepad, or a message to yourself). You will need it twice: for the README in Part 3 and for LinkedIn in Part 5.
5. Screenshot: click **View** (top-right) so the editing toolbars disappear. Then take a screenshot of the whole window: **Windows:** press **Windows + Shift + S**, drag over the dashboard, then open the notification and click Save. **Mac:** press **Command + Shift + 4** and drag over the dashboard; the file appears on your Desktop.
6. Rename the screenshot to **dashboard.png** and move it into the project folder at **olist-ecommerce-analytics / images /**, replacing the file already there (click **Replace** when asked). If your screenshot is a .jpg, that is fine too: just also change the line in README.md from images/dashboard.png to images/dashboard.jpg in Part 3.

Check: Open the link you copied in a private/incognito browser window. If the dashboard appears without asking you to log in, sharing is correct.

Part 3 — Put the folder on GitHub with VS Code

Plain-English version of what happens here. Git is a program that tracks versions of files. GitHub is a website that stores Git projects online. VS Code is a text editor that has a built-in terminal and Git buttons. You will: install the two programs, open your folder in VS Code, paste the dashboard link into the README, create an empty repository on github.com, and then send (push) your folder to it.

3.1 Install VS Code and Git (one time only)

1. Go to **code.visualstudio.com** → click **Download** → run the installer. Accept all defaults. On Windows, keep the box *Add to PATH* ticked.
2. Go to **git-scm.com/downloads** → download for your system → run the installer. Accept all defaults (there are many screens; just keep clicking Next). **Mac:** alternatively open the Terminal app, type **git --version**, press Enter, and if a window offers to install developer tools, click Install.
3. Restart your computer, or at least close and reopen any open terminal, so the new programs are found.

3.2 Create your empty repository on GitHub (in the browser)

1. Go to **github.com** and sign in (or **Sign up**: email, password, username; the username becomes part of your project link, so pick something professional like your name).
2. Top-right, click the **+** icon → **New repository**.
3. Repository name: **olist-ecommerce-analytics** (type it exactly like that, with the dashes).
4. Description: **Olist e-commerce data cleaning with pandas and a Looker Studio sales dashboard**.
5. Choose **Public**.
6. **Leave every checkbox unticked** (no README, no .gitignore, no license). Your folder already has these files; adding them here would cause a conflict.
7. Click **Create repository**. GitHub shows a page with commands. Keep this tab open; you will copy one line from it.

3.3 Open the project in VS Code

1. Open VS Code. Menu **File → Open Folder…** (Mac: **File → Open…**). Select the **olist-ecommerce-analytics** folder on your Desktop (the folder itself, not a file inside it) → **Select Folder / Open**.
2. If a dialog asks *Do you trust the authors of the files in this folder?* click **Yes, I trust the authors**.
3. The left sidebar (**Explorer**) now lists your files. This is the same folder you unzipped.

3.4 Paste the dashboard link into the README

1. In the Explorer click **README.md**. It opens in the editor.
2. Press **Ctrl + F** (Mac: **Command + F**), type **PASTE_LOOKER**, press Enter. The cursor jumps to the placeholder text *PASTE_LOOKER_STUDIO_LINK_HERE*.

3. Select exactly that placeholder text (double-click it, or drag over it) and paste your Looker Studio link in its place with **Ctrl + V**. The line should look like **[Looker Studio report](https://lookerstudio.google.com/reporting/....)** with no spaces inside the brackets.
4. Save with **Ctrl + S** (Mac: **Command + S**).
5. Optional: in the Explorer, right-click **GITHUB_AND_LINKEDIN_STEPS.md** → **Delete**. It was a note for you, not part of the project. Confirm.

Tip: To see how the README will look on GitHub, click README.md in the Explorer and press **Ctrl + Shift + V** (Mac: Command + Shift + V). A preview opens showing headings, the table and your screenshot.

3.5 Open the terminal and tell Git who you are (one time only)

1. Menu **Terminal → New Terminal**. A panel opens at the bottom of VS Code. It is already inside your project folder.
2. Type each line below and press Enter after it. Use your real name and the email you use for GitHub:

```
git config --global user.name "Hafiz Gohar"
git config --global user.email "hafizgohardev@gmail.com"
```

Nothing visible happens; that is normal.

3.6 Upload (push) the folder

Type these lines one at a time into the terminal, pressing Enter after each. Wait for each one to finish before typing the next. The only line you must change is the one containing **YOUR-USERNAME**: replace it with your GitHub username (it is also visible in the GitHub tab from step 3.2, in the line starting *git remote add origin*; you can copy that whole line from there instead).

```
git init
git add .
git commit -m "Olist e-commerce data cleaning notebook and dashboard"
git branch -M main
git remote add origin https://github.com/YOUR-USERNAME/olist-ecommerce-analytics.git
git push -u origin main
```

What each line does, so it is not magic:

Command	Meaning
git init	Start tracking this folder with Git.
git add .	Mark every file in the folder to be included (the dot means 'everything here').
git commit -m "..."	Save a snapshot with a message describing it.
git branch -M main	Name the main line of history 'main', which is what GitHub expects.
git remote add origin ...	Tell Git the web address of the empty repository you made in 3.2.
git push -u origin main	Send the snapshot to GitHub. A browser window will pop up asking you to sign in to GitHub and click Authorize; do that once, then the upload continues.

Check: refresh the GitHub tab. You should see your files, and the README (with your screenshot and link) displayed underneath them. Click **olist_data_cleaning.ipynb**: GitHub shows the whole notebook with its tables and outputs.

If something goes wrong

Message you see	What to do
'git' is not recognized / command not found	Git is not installed or VS Code was open during the install. Close VS Code completely, reopen it, open the folder again, and retry. If it still fails, reinstall Git from git-scm.com.
Author identity unknown	Step 3.5 was skipped. Run the two git config lines, then run the git commit line again.
remote origin already exists	You ran the remote line twice. Type **git remote set-url origin https://github.com/YOUR-USERNAME/olist-ecommerce-analytics.git** then continue with git push.
rejected / fetch first / non-fast-forward	You ticked 'Add a README' when creating the repository. Easiest fix: on GitHub, repository **Settings** → scroll to the bottom → **Delete this repository** → recreate it with all boxes unticked → run only the last line (git push -u origin main) again.
Permission denied / authentication failed	The browser sign-in did not complete. Run **git push -u origin main** again and finish the sign-in window that appears.
Nothing happens after git push for a long time	Look for a hidden browser window or a VS Code pop-up asking you to sign in to GitHub.

Making a change later (for example a better screenshot)

Edit or replace the file in the folder, then in the VS Code terminal run:

```
git add .
git commit -m "Update dashboard screenshot"
git push
```

Part 4 — Pin the repository and polish the repo page

4.1 Pin it on your profile

1. Go to **github.com/YOUR-USERNAME** (click your avatar top-right → **Your profile**).
2. Find the section **Pinned** (if you have no pins yet it says *Customize your pins* or *Pin repositories*). Click **Customize your pins**.
3. Tick **olist-ecommerce-analytics** → **Save pins**. It now appears at the top of your profile.

4.2 Add the description, website link and topics

1. Open the repository page. On the right, next to **About**, click the small **gear** icon.
2. Description: already filled from step 3.2; keep it or edit it.
3. **Website:** paste your Looker Studio link. Visitors can open the live dashboard directly from the repo page.
4. **Topics:** type each and press Enter: **pandas**, **data-cleaning**, **looker-studio**, **ecommerce**, **data-analysis**.
5. Click **Save changes**.

Check: your profile page shows the pinned card with the description; the repo page shows the live-dashboard link under About.

Part 5 — Add both projects to your LinkedIn Featured section

The Featured section sits near the top of your profile and shows big cards with a thumbnail. You will add two links: the Looker Studio dashboard and your warehouse project.

5.1 Make sure you have a Featured section

1. Open **linkedin.com** → click **Me** (top-right) → **View profile**.
2. If you already see a **Featured** heading on your profile, skip to 5.2.
3. Otherwise click **Add profile section** (below your headline) → open **Recommended** → click **Add featured**. LinkedIn creates the section and opens the add menu.

5.2 Add the dashboard

1. In the Featured section click the **+** icon → **Add a link**.
2. Paste the Looker Studio link → click **Add**. LinkedIn loads a preview; it often cannot read a thumbnail from Looker Studio, so a grey box is normal.
3. **Title:** Olist E-Commerce Sales Dashboard (Looker Studio)
4. **Description:** One-page dashboard on 98,000+ Brazilian e-commerce orders: revenue trend, orders by month, top 10 products, revenue by region and average delivery days. Data cleaned with pandas; full notebook on GitHub.
5. If there is an option to **Upload a thumbnail** / edit the image, upload **images/dashboard.png** from your project folder. This makes the card look much better.
6. Click **Save**.

5.3 Add the warehouse project

1. Click **+** → **Add a link** again.
2. Paste the warehouse project's link (its GitHub repository link, or a live link if it has one) → **Add**.
3. **Title:** the project's name, for example *Retail Data Warehouse (SQL + Python)*. Keep it under about 8 words.
4. **Description:** two sentences in the same shape as the dashboard one: what problem it solves, then what you built. Example: *Designed a star-schema data warehouse for retail sales data: fact and dimension tables, ETL scripts in Python, and analysis queries in SQL. Includes schema diagrams and sample reports.* Adjust to what your project actually contains.
5. Upload a screenshot or diagram of it as the thumbnail if you have one. Click **Save**.

5.4 Order and check

1. Click the **pencil** icon on the Featured section. Use the drag handles to put the dashboard first and the warehouse project second. Save.
2. Open your profile in a private/incognito window (or ask a friend) to see what visitors see: both cards should be visible and clickable.

Tip: Also add the GitHub repository itself as a third Featured link (title: *Olist E-Commerce — Data Cleaning Notebook (GitHub)*). Recruiters like seeing the code next to the dashboard.

Final checklist

	Item	How to verify
☐	Looker Studio report has 5 tiles and a title	Open it in View mode: revenue trend, orders by month, top 10 products, revenue by region, average delivery days = 12.6
☐	Sharing set to Anyone with the link	Open the link in an incognito window; no login prompt
☐	Screenshot saved as images/dashboard.png in the project folder	The file in the folder is your screenshot, not the preview chart
☐	README has the real link	Open README.md: no text 'PASTE_LOOKER' remains
☐	Repository is public on GitHub	github.com/YOUR-USERNAME/olist-ecommerce-analytics opens in incognito and shows the README with the image
☐	Repository is pinned	Your GitHub profile shows it under Pinned
☐	About has the dashboard link and topics	Repo page, right-hand column
☐	LinkedIn Featured has the dashboard and the warehouse project	Profile in incognito shows both cards

Headline numbers (in case anyone asks you about the project)

Metric	Value	Where it comes from
Orders analysed	98,199 billable orders (cancelled/unavailable excluded)	Notebook section 6
Total revenue	R$ 15.7 million (≈ US$ 4.3 million at 3.65 BRL/USD)	Notebook section 6
Average delivery time	12.6 days; 91.9% delivered on or before the promised date	Notebook section 3
Biggest region	Southeast = 65% of revenue; São Paulo alone 37%	Notebook section 6
Peak month	November 2017 (Black Friday): R$ 1.17M, 7,421 orders	Monthly table
Problems fixed	261,831 duplicate rows; 814 reviews on multiple orders; 610 products without category; 8 timestamp columns stored as text; 304 payment mismatches flagged	Notebook sections 1 to 4

Thirty-second description you can say or write about this project

"I took Olist's public dataset of about 100,000 Brazilian e-commerce orders, cleaned it in pandas (duplicates, missing values, date parsing and currency reconciliation, each documented in its own notebook section), and built a one-page Looker Studio dashboard covering revenue trend, monthly orders, top products, revenue by region and delivery performance. The main finding was that revenue is concentrated in the Southeast while delivery times in the North and Northeast are two to three times longer, which is where the business should invest next."
